The HR 40-D(g) Cx (B) 1. does not apply to the transmission of digital radio signals, even though digital radio signals can contain audio information. 2. Digital radio can be transmitted as a single frequency in a tone. 3. The assignment of tones to other information must be done in such a manner that the signals can be differentiated in the RF spectrum. TIA Trivial Pursuit C63.26-2015 pdf 38bfdcm TIA Trivial Pursuit C63.26-2015 Part 25 (above 3 GHz) A d J C T 37. Section 15 f. Hz. 39. does not apply to the transmission of digital radio signals. Digital radio can be transmitted as a single frequency in a tone. It is the responsibility of the transmitting and receiving stations to determine the tone assignment for the digital radio signal. If a receiving station wishes to detect a digital radio signal, it must be able to determine the identity of the carrier signal. This can be done by determining the frequency of the carrier signal. The transmitting and receiving station can assign a different tone to the digital signal to identify the digital signal. By using different tones, the digital radio signal can be detected from the RF spectrum. An additional method to detect the digital radio signal is to select one or more of the tones in the spectrum which will be transmitted with the digital radio signal and then measure the level of each tone. If the level of the tones is different from the other tones, it can be determined that the signal is a digital radio signal. 38bfdcm Part 22 (above 3 GHz) TIA Trivial Pursuit C63.26-2015 pdf 38bfdcm TIA Trivial Pursuit C63.26-2015 Part 22 (above 3 GHz) TIA Trivial Pursuit C63.26-2015 pdf 38bfdcm TIA Trivial Pursuit C63.26-2015 Part 15 (above 3 GHz) TIA Trivial Pursuit C63.26-2015 pdf 38bfdcm TIA Trivial Pursuit C63.26-2015 Part 15 (above 3 GHz) TIA Trivial Pursuit C63.26-2015 pdf 38bfdcm

Mapping of the FCC International Designator was implemented in 7-Feb-2006 and previously mapped under 33.007(b)(1)(i)(A) and (b)(2)(i). Complete mapping of FCC ID in IDN -> EAN and vice versa as well as the search for identical EAN and EAN-like IDN The association between the EAN number and the FCC International Designator is not always clear and defined. It is not unusual for different organisations to use the same or similar EAN or EAN-like codes for multiple parts of a product line and with multiple manufacturer codes, and have no relationship between them at all. For instance, two electric motors with the same manufacturer code might have completely different EAN numbers and vice versa. As this is especially common with small manufacturers, the EAN number itself is not sufficient to identify the part. Example: + 2492ce491b
