I would like to know, how can I download the.rar file with all the.rar files, as a single.rar file? And please answer quickly, because I don't have time to sleep yet. Thanks. A: You could list all the files in the directory, then combine the list into a single string, then pass that string to unrar, e.g.

```
#!/usr/bin/env bash shopt -s globstar files=( '*.rar' )  
for file in "${files[@]}"; do unrar "$file" done
```

Q: php if function inside class, is there a better alternative? I'm not sure if this is the correct forum for this, but I can't find anything that seems to cover this exact issue. So basically I'm looking for a better way to handle the following syntax. Right now I have:

```
class myClass {  
    function myFunction1() {  
        if($something) {  
            $function1 = 'function 2';  
        } else {  
            $function1 = 'function 1';  
        }  
    }  
    function myFunction2() {  
        $function1();  
    }  
}  
$className = new myClass;  
$className->myFunction1();  
$className->myFunction2();
```

I'm looking to get rid
