Field of the Invention The present invention relates to a printing apparatus such as a digital copier, a facsimile machine, and a printer. More particularly, the invention relates to an ink jet printing apparatus having improved reliability by reducing the risk of an ink jet nozzle being clogged. 2. Description of the Related Art Generally, in a printing apparatus that carries out the image forming process by using an ink jet printing method, the ink inside an ink tank is supplied to an ink jet head, and the ink is then supplied to a printing medium through a pressure chamber. A pressure chamber is communicated with a nozzle (ink jet nozzle) of the ink jet head, and when the inside of the pressure chamber is filled with ink, the ink is supplied to the printing medium. As the printing medium is fed, the printing process is carried out. During printing, the ink within the nozzle of the ink jet head is consumed, and therefore, the ink in the nozzle gradually becomes dry. Thus, in order to maintain printing quality and obtain a stable ink discharge state, it is necessary to supply the ink to the nozzle at a suitable flow rate. Japanese Patent Laid-Open No. 2005-143719 discloses a printing apparatus in which an ink discharge rate is controlled by controlling the opening of a first valve that is provided upstream of a pressure chamber and a second valve that is provided downstream of the pressure chamber. The first valve and second valve are driven based on the amount of ink discharged to the outside of the printing apparatus, the difference between the ink discharge amount and the ink discharge amount, and the difference between the ink discharge amount and the ink discharge amount, which are detected by a detection unit. In the printing apparatus disclosed in Japanese Patent Laid-Open No. 2005-143719, as ink is consumed during printing, the opening of the first valve is gradually reduced. Therefore, the pressure in the pressure chamber is reduced. Thus, the size of the pressure chamber is also gradually reduced, and as a result, the flow rate of ink that is supplied from the ink tank to the pressure chamber is reduced. When the opening of the first valve is reduced to a value or less close to 0, ink is not supplied to the pressure chamber. Thus, the liquid level in 4bc0debe42
