Now we're gonna learn how to draw some great Graphics. First let's learn some drawing basics. 1. What is Drawing? A drawing is a visual representation of your idea. A drawing is made up of objects, lines, curves, planes and other visual representations. You can draw on paper, on a computer screen, a tablet, on virtual reality headsets, on a napkin, on the floor, in a bubble, or whatever. A drawing can be a single line, a line segment or a circle. A drawing can be about a person, or a place, or a thing. A drawing is a representation of an idea. 2. What is a Drawing? A drawing is any representation of a scene, object, or process using lines, shapes, colors, and other features. A drawing is a collection of lines, shapes, and colors. A drawing is a representation of a scene, object, or process. A drawing is a 2 dimensional representation of a 3 dimensional object. 3. Basic Drawing Guidelines Drawing is about making things easy for you and hard for others to find what you're trying to hide. 1. Don't underestimate the power of a simple line. The simplicity of a line is deceptive. Most people don't notice the line. 2. Connections are powerful. Connect your objects by drawing shapes that represent the relationship between objects. 3. Make parts simpler. Simplifying parts makes it easier to understand the whole. 4. Objects in Context. Show the relationships between objects. 5. Show the Relationships of Objects. Show the relative position of objects in space. 6. Drawing is a process, not an art form. Making a drawing is not an art, it's a craft. 7. Draw for Others. Draw for other people, and not just for yourself. 8. Make your work accessible. Keep your work readable. 9. Draw a Stick Figure. Any figure can have points of reference, but a stick figure has only one. 10. You are not making art. You are making a drawing. 11. One object at a time.

One such condition is a Read Condition Cell (RCC). A Read Condition Cell is a memory cell that will read incorrect data when it has its bit line precharged to a first voltage. A Read Condition Cell is typically detected by testing the data stored in the memory cell. When a Read Condition Cell is detected, the result of the test is typically ignored. However, the RCC is very difficult to deal with, since there may be a large number of such cells in a particular integrated circuit (IC). One prior art solution is to provide a memory cell having four transistors. Each transistor is formed in a well region that is separate from a well region into which the other three transistors are formed. If a Read Condition Cell is present, the two transistors that are formed in the well region have a current leakage path to a bit line. This prevents the RCC from functioning correctly. However, this prior art solution is not desirable because it requires additional fabrication steps, and may increase the size of the memory cell. Another prior art solution is to provide a memory cell that has only two transistors. Such a memory cell is described in U.S. Pat. No. a1d647c40b
